Exercise: apply to each 1

5.0/5.0 points (graded)

ESTIMATED TIME TO COMPLETE: 2 minutes

Here is the code for a function `applyToEach` :

```
def applyToEach(L, f):
    for i in range(len(L)):
        L[i] = f(L[i])
```

Assume that

```
testList = [1, -4, 8, -9]
```

For each of the following questions (which you may assume is evaluated independently of the previous questions, so that `testList` has the value indicated above), provide an expression using `applyToEach` , so that after evaluation `testList` has the indicated value. You may need to write a simple procedure in each question to help with this process.

Example Question:

```
>>> print(testList)
[5, -20, 40, -45]
```

Solution to Example Question

```
def timesFive(a):
    return a * 5

applyToEach(testList, timesFive)
```

```
>>> print(testList)
[1, 4, 8, 9]
```

```
1 # Your Code Here
2 def positive(a):
3     return abs(a)
4 applyToEach(testList, positive)
```

Press ESC then TAB or click outside of the code editor to exit

Correct

Test results

Exercise: apply to each 2

5.0/5.0 points (graded)

ESTIMATED TIME TO COMPLETE: 4 minutes

```
>>> print(testList)
[2, -3, 9, -8]
```

```
1 # Your Code Here
2 def addOne(b):
3     return b + 1
4
5 applyToEach(testList, addOne)
```

Press ESC then TAB or click outside of the code editor to exit

Correct

Exercise: apply to each 3

5.0/5.0 points (graded)

ESTIMATED TIME TO COMPLETE: 4 minutes

```
>>> print testList
[1, 16, 64, 81]
```

```
1 # Your Code Here
2 def squared(c):
3     return c**2
4
5 applyToEach(testList, squared)
```

Press ESC then TAB or click outside of the code editor to exit

Correct

Test results
